I

AB A series of naphthyridine and naphthyridinone allosteric dual inhibitors of Akt1 and 2 have been developed. These compds. have been optimized to have potent dual activity against the activated kinase as well as the activation of Akt in cells. One compound (I) has potent inhibitory activity against Akt1 and 2 in vivo in a mouse lung and efficacy in a tumor xenograft model.

AB This communication reports a new synthetic route of pyridopyrimidines, e.g., I, to facilitate their structural optimization in a library fashion and describes the development of pyridopyrimidines that have excellent enzymic and cell potency against Akt1 and Akt2. This series also shows a high level of selectivity over other closely related kinases and significantly improved caspase-3 activity with the more optimized compds.

OS CASREACT 148:552728

AB This letter shows inhibitor SAR on a pyridine series of allosteric Akt inhibitors to optimize enzymic and cellular potency. We have optimized 2,3,5-trisubstituted pyridines to give potent Akt1 and Akt2 inhibitors in both enzyme and cell based assays. In addition, we will also highlight the pharmacokinetic profile of an optimized inhibitor that has low clearance and long half-life in dogs.

AB Methods for treating muscular wasting diseases such as Duchenne muscular dystrophy are disclosed. Specifically, the methods include administering to a subject in need of treatment a nuclear factor kappa B (NF-KB) activation inhibitor capable of blocking the activation of NF-KB. Administration of peptides comprised of a Nuclear Factor Essential (NEMO) binding domain to a mouse model of Duchenne muscular dystrophy significantly increased diaphragm contractions.

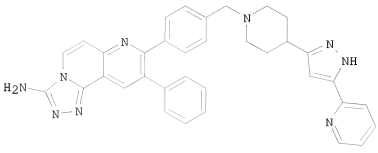
I



II

AB The invention provides for substituted naphthyridine compds. of formula I that inhibit Akt activity. Compds. of formula I wherein E, F, G, H, I, J, K, L and M are independently (un)substituted C and N; n is 0, 1, 2, 3, 4, and 5; each R2 and R3 are independently oxo, acyl, carbonyloxyalkyl, alkyl, carbonyloxyaryl, aryl, CO2H and derivs., halo, OH, etc.; Z is C3-8 cycloalkyl, (hetero)aryl, and heterocyclyl; and a pharmaceutically acceptable salts and stereoisomers thereof, are claimed. In particular, the compds. disclosed selectively inhibit one or two of the Akt isoforms. The invention also provides for compns. comprising such inhibitory compds. and methods of inhibiting Akt activity by administering the compound to a patient in need of treatment of cancer. Example compound II was prepared by chlorination of 3-phenyl-2-(4-[[-5-pyridin-2-yl-1H-1,2,4-triazol-3-yl)piperidin-1-yl]methyl]phenyl-1,6-naphthyridin-5(6H)-one; The resulting 5-chloro-3-phenyl-2-(4-[[-5-pyridin-2-yl-1H-1,2,4-triazol-3-yl)piperidin-1-yl]methyl]phenyl-1,6-naphthyridine underwent hydrazination to give 5-hydrazino-3-phenyl-2-(4-[[-5-pyridin-2-yl-1H-1,2,4-triazol-3-yl)piperidin-1-yl]methyl]phenyl-1,6-naphthyridine, which underwent cyclization with 1,1'-diimidazol-1-ylmethanamine to give compound II. All the invention compds. were evaluated for their Akt inhibitory activity.

AB The instant invention provides for compds. of general formula I (wherein n = 0-4; p = 0-5; u, v, w, x, y, and z = CH and N; Ring K = (C3-C8)cycloalkyl, aryl, heteroaryl and heterocyclyl; R1 and R2 = oxo, carbonyl alkoxy, carbonyl aryloxy, etc.; R3 and R4 = H, (C1-C6)alkyl, (C1-C6)perfluoroalkyl, etc.; R5 = substituted amino; R6 = carbonyl alkoxy, C2-C10 alkenyl, etc.) that inhibit Akt activity. In particular, the compds. disclosed selectively inhibit one or two of the Akt isoforms. The invention also provides for compns. comprising such inhibitory compds. and methods of inhibiting Akt activity by administering the compound to a patient in need of treatment of cancer. Preparation of I is

exemplified. For example, II was prepared in 5 steps from an initial reaction between tert-Bu (2-chloro-3-formylpyridin-4-yl)carbamate and 1-[4-(1,3-Dioxolan-2-yl)phenyl]-2-phenylethanone. In Akt kinase assays, the example compds. had IC50 values ≤ 50 μM against one or more of Akt1, Akt2, and Akt3. Also exemplified in the patent is cloning of human Akt isoforms and ΔPH-Akt1.

AB Title compds. I [Ring A forms a fused substituted 6-membered ring containing N; R1 and R2 independently = H, alkyl, perfluoroalkyl or combined to form a carbocycle or heterocycle; R3 independently = halo, alkyl, hydroxyalkyl, etc.; R4 independently = halo, oxo, OH , CN, etc.; m = 0-4; n = 0-1; p = 0-4; Q = aryl, arylcarbonyl, heterocycle, etc.], and their pharmaceutically acceptable salts, are prepared and disclosed as having the ability to inhibit the activity of Akt, a serine/threonine protein kinase. Thus, e.g., II was prepared via reductive amination of 4-(5-methoxy-3-phenyl-1,6-naphthyridin-2-yl)benzaldehyde (preparation given) with 2-(3-piperidin-4-yl-1H-1,2,4-triazol-5-yl)pyridine dihydrochloride (preparation given) followed by demethylation. In described assays for Akt kinase inhibition, specific compds. of the invention were tested and found to have IC50 values of ≤ 50 μM against one or more of Akt1, Akt2 and Akt3. The invention is further directed to chemotherapeutic comprns. containing the compds. of this invention and methods for treating cancer comprising administration of the compds. of the invention. These substituted naphthyridines have unexpected advantageous properties when compared to other naphthyridines reported in PCT publication WO2003/086394, such unexpected advantageous properties may include increased cellular potency/solubility, greater selectivity, enhanced pharmacokinetic properties, lack of off target activity, etc.

* STRUCTURE DIAGRAM TOO LARGE FOR DISPLAY - AVAILABLE VIA OFFLINE PRINT *

AB The present invention relates to methods of treating cancer using a combination of at least two Akt inhibitors I [wherein Q = (un)substituted heterocyclyl, aryl; U, V, W, and X = independently CH, N; Y, Z = independently CH, N, provided that at least one of Y and Z = N; n = 0-3; p = 0-2; q = 0-4; R1, R2, R7 = independently halo, CN, OH, CHO, NO2, or (un)substituted (cyclo)alkyl(oxy), alkenyl(oxy), alkynyl(oxy), heterocyclyl(oxy), acyl, carboxy, carbamoyl(oxy), ureido, sulfamoyl, etc.; R3, R4 = independently H, (perfluoro)alkyl; or CR3R4 = cycloalkyl, heterocyclyl; and pharmaceutically acceptable salts or stereoisomers thereof] or a combination of I and a protein kinase inhibitor II [wherein G = H2, O; X = C, N, SO0-2, O; m = 0-2; n = 0-2; p = 0-6; q = 0-4; R1 = independently H, halo, or (un)substituted (cyclo)alkyl, heterocyclyl, aryl, carbamoyl, amino, acyl, sulfamoyl, carboxy, etc.; R2 = H or (un)substituted (cyclo)alkyl(oxy), amino, aryloxy, heterocyclyloxy, alkenyloxy, alkynyloxy, etc.; R5 = independently H, halo, NO2, CN, or (un)substituted alkyl, alkenyl, alkynyl, carboxy, acyl, sulfamoyl, carbamoyl, ureido, amino, etc.; and pharmaceutically acceptable salts or stereoisomers thereof], optionally in combination with a third compound Examples include syntheses for I and II and assays demonstrating Akt inhibitor activity, antitumor activity, and the synergistic effect of combinations of AKT inhibitors and/or protein kinase inhibitors on caspase 3 activity. For instance, III•HCl was prepared in an 8-step reaction sequence culminating with the cycloaddn. of 4-(2-aminoprop-2-yl)benzil and o-phenylenediamine using glacial acetic acid in H2O, followed by work up with chloroform and ethanolic HCl. III•HCl, a selective Akt1 and Akt2 inhibitor, demonstrated a 3.2-fold in caspase 3 activation over control compared to a 1.2-fold increase for a protein kinase inhibitor. Combination treatment produced a 9-fold increase in caspase 3 activation.

AB Triazolo[4,3-b]pyridazines I [R1 = (un)substituted Ph, furyl, thienyl, pyridinyl; R2 = substituted NH2, OH; R3 = H, R4 = (un)substituted cycloalkyl, aryl; R3R4 = (un)substituted CH:CHCH:CH] and quinazolines II [R5, R6 = (un)substituted Ph; R7 = H, alkyl, halogen, OH, alkoxy] were prepared for use as inhibitors of one or two of the isoforms of Akt, a serine/threonine protein kinase, acting particularly on the pleckstrin homol. domain of Akt. Thus, 3,6-dichloropyridazine was converted to its 4-cyclobutyl derivative which was cyclized with BzNHNH2 and aminated to give I [R1 = Ph, R2 = NHCH2CMe2CH2NMe2, R3 = H, R4 = cyclobutyl]. This compound had IC50 for inhibition of Akt1 of 1.4 μM.
